Workflows

Workflows

Workflows are the way we **organise** how we **contribute** to the project we're working on, we choose workflow based on the type of project we're working on, common types are:

- **GitHub Flow**
- **Git Flow**
- **Forking**

Workflows

GitHub Flow

GitHub Flow

Number of repositories: 1

Contribution Method: a branch-based work flow

Steps: [GitHub Flow]

Why/When to use:

1. organise features/bug-fixes
2. have a semi-documentation
3. small projects either individual or collaborative

Workflows

Git Flow

GitHub Flow

Number of repositories: 1

Contribution Method: a branch-based work flow

Steps: [GitHub Flow]

Why/When to use:

1. organise features/bug-fixes
2. have a semi-documentation
3. small projects either individual or collaborative

Git Flow

Number of repositories: 1

Contribution Method: we have multiple branches each serves a specific purpose.

Steps: **GitFlow**

Usage: better management for releases.

Tools: **git-flow** installation

Workflows

Forking Flow

Forking Flow

Each repository has **two** rights:

- **reading** i.e. **cloning**
- **writing** i.e. **pushing**

Forking Flow

You gain reading right if:

- the repository is public
- you’re a contributor in that repository

Forking Flow

You gain writing right if:

- you’re a contributor in that repository

Forking Flow

You gain writing right if:

- you’re a contributor in that repository

not a contributor but want to be?

Forking Flow

You gain writing right if:

- you’re a contributor in that repository

not a contributor but want to be?

make a fork

Forking Flow

What’s a fork?

it’s a **remote** copy of the repository

Forking Flow

Number of repositories: as many as the number of outside contributors

Contribution Method: using forks & Pull requests

Steps:

1. fork the repository
2. clone the fork
3. add the original repository as a remote
4. commit & push changes to your fork
5. make a pull request to original repository

practical

Forking Flow

Number of repositories: as many as the number of outside contributors

Contribution Method: using forks & Pull requests

Steps:

1. fork the repository
2. clone the fork
3. add the original repository as a remote
4. commit & push changes to your fork
5. make a pull request to original repository

but why?

practical

Thank You
